Staff Java Software Developer

Caseware

$23.000.000 COP - $26.000.000 COP (Integrales) Permanent contract (indefinido), full-time | 100% remote

---

About Caseware

Caseware is one of Canada's original Fintech companies, having led the global audit and accounting software industry for over 30 years. The company has more than 500,000 users across 130 countries, available in 16 different languages. Over 36,000 accounting and audit professionals list Caseware as a skill on their LinkedIn profiles.

As a **Staff Java Software Developer**, you are a professional who combines strong hands-on Java skills with the ability to influence across teams and reduce ambiguity. Architectural decisions and standards are shaped through this role, acting as a technical leader through design reviews and RFCs, and mentoring senior and junior engineers alike.

You serve as a core contributor on the platform, with direct impact on the value Caseware delivers to customers and distribution partners globally, owning key features and architectural improvements end-to-end, from design through build, using modern, leading-edge technology and architecture. This role does not include managing a development team directly, since Caseware already has managers for that function. Instead, the focus is on leading projects, driving architectural and technical decisions, and collaborating with developers, product managers, and security teams to move projects forward.

Location

This is a fully remote position based in Colombia, collaborating with global English speaking teams.

Tech Stack

- Languages & Frameworks: Java (Java 21 or Java 25 preferred)
- Cloud & Infrastructure: AWS (S3, Secrets Manager, Lambda, SQS, SNS, DynamoDB, EKS, etc.), CloudFormation, Terraform.
- Data: SQL Server, AWS RDS SQL Server, MongoDB or similar NoSQL databases.
- Testing & Observability: New Relic, AWS CloudWatch.
- Tooling: Jira, Visual Studio, GitHub, Devin, Claude Code.

Core Responsibilities

- Define and evolve technical architecture, establishing standards that support safe, scalable, and reusable capabilities across teams.
- Act as a technical leader across teams, influencing architectural decisions through design reviews, RFCs, and hands-on collaboration.
- Own key features and architectural improvements end-to-end, from design through build, using modern, leading-edge technology and architecture.
- Lead software architecture decisions with a particular focus on distributed systems and microservices, keeping scalability as a central design consideration.
- Lead proof-of-concepts that inform roadmap and architectural decisions.
- Partner with QA, Product, Security, and Domain SMEs to ensure robust observability, reliability, and quality of the systems you own.
- Establish and promote engineering standards and best practices to improve consistency, security, and maintainability.
- Drive operational excellence by identifying systemic risks and eliminating root causes that impact reliability, performance, or cost.
- Partner with DevOps and Security teams to evolve CI/CD pipelines, deployment strategies, and production safeguards.
- Mentor senior and junior engineers through code reviews, design discussions, and technical guidance.
- Participate in production support as a senior escalation point, leading root cause analysis and driving preventative improvements.

- Collaborate with a team of deep technical experience and strong domain knowledge, within an agile team of developers, testers, and a product owner.

AI-Augmented Development Expectations

- Champion effective, responsible use of AI-assisted development tools across multiple teams.
- Define standards and guardrails for how AI-assisted and agentic tooling is used across the SDLC, balancing velocity with correctness, security, and maintainability.
- Mentor senior and junior engineers on advanced AI-assisted development practices.

Role Requirements

- 8+ years of professional software engineering experience, with demonstrated impact beyond a single team.
- In-depth, extensive experience with server-side Java, viewed as a subject matter expert on all things Java.
- Solid experience designing software architecture in general, with particular strength in distributed architectures and microservices, and a consistent focus on scalability.
- Advanced spoken English level.
- Experience delivering cloud-native systems on AWS (S3, Secrets Manager, Lambda, SQS, SNS, DynamoDB, EKS, etc.)
- Experience working with both monolith applications and microservices.
- Good experience with containerization and orchestration (Docker, Kubernetes).
- Knowledge of relational databases, such as SQL Server, alongside NoSQL experience.
- Solid software engineering fundamentals and the ability to balance delivery speed with long-term platform health.
- Proven experience contributing to, and taking ownership of, important architectural decisions.
- Experience working in an agile team with other developers, testers, and a product owner.
- Strong communication skills and the ability to influence technical direction and align stakeholders around key decisions.
- Strong initiative to improve processes, tools, methodologies, and product quality.

The strongest candidates for this role combine modern architectural design skills with a solid foundation in Java and communicate well with other stakeholders when architectural decisions need to be made.

Hiring Process

- Interview with an Alcor recruiter.
- Technical take-home challenge.
- 15-minute interview with Caseware's HR Team.
- Technical interview with a Lead/Manager.

Perks & Benefits

Salary range: $23.000.000 COP - $26.000.000 COP (Integrales)

- Permanent contract (“Contrato a término Indefinido”) with all legal benefits.
- Prepaid medicine.
- Life insurance and funeral assistance.
- Internet allowance.
- Home office stipend.
- 100% remote work environment and a strong work-life balance.
- Budget for training and professional growth.
- 5 Personal Time Off days per year.
- Sick Leave top-up to 100% of salary, paid by the employer from Day 3 to Day 90.
